PhotoMapper Server

Manage, Find, Map, Share your photos

PhotoMapper Server is a corporation-wide solution for managing large amounts of digital photos. While storing all your images in a central drive, it is possible to explore them efficiently from all workstations. The intuitive browser-interface and the connection to the ArcGIS Server are pionee-ring..

alta4**geoinformatik**ag

You never have to ask again in which location photos were taken and where they are stored within your company network.

By providing a central picture database PhotoMapper Server organizes your data pool. Your current photos will be imported automatically while all users can easily add new pictures to the database.

The graphical user interface uses the embedded GPS-coordinates for localisation in the interactive map. Due to the possibility off tagging and exploring the Exif-Header of your image files it is really simple to find all photos with their exact location in the map.

You can easily add photos without coordinate information by using the drag and drop function in the map. Different user profiles make it possible to manage photos between departments and sections within your company or organisation.

Especially large companies with wide spread organisation structures will benefit from the possibility to use their complete data pool of digital photos independently from the person who took the pictures.

Feature List

For whom?
- Users with many photos (10.000 and more)
- Organisations with wide spread branches
- Different roles between documentation (photographer) and user (information system)

System requirements (Server):
